MODULE	**ITC 2205 – SOFTWARE ENGINEERING PRACTICES (LEVEL 4)**		
TERM	**SPRING SEMESTER 2025**		
ASSESSMENT	**TEAM PROJECT**	**WEIGHT**	**60%**
RELEVANT LEARNING OUTCOMES	1. Demonstrate understanding of the major SE methodologies and the SW development lifecycle. 2. Use essential SE tools and techniques. 3. Utilize contemporary code development practices. 4. Demonstrate understanding of the attributes of good software and the SE code of ethics in professional practice.		
DELIVERABLES	1. **Progress deliverables**: • Preparation: Team Details, Timetable • PM deliverables 2 and 3 as agreed. 2. **Final submission**: a. Report b. Source Code c. Object Code d. PowerPoint Presentation (visual aid)		
METHOD OF SUBMISSION	1. **Progress deliverables**: Blackboard and/or Progress meetings 2. **Final submission**: • Report: Blackboard through Turnitin • Source: Blackboard • Object Code: Blackboard; in-class presentation • PowerPoint Presentation: Blackboard; in-class presentation **Note**: All deliverable methods are mandatory and essential for the marking process.		
PROFESSOR NAME	**Prof. Evgenia Vagianou**		
SUBMISSION DEADLINES (BY 10:00 ON ALL DATES) **&** **PRESENTATIONS DATES/TIMES**	**PROGRESS DELIVERABLES:** ***as per the outline*** **FINAL SUBMISSION** ***Project, PPT: Wednesday, April 22, 2026*** ***Reviews: Friday, April 24, 2026*** ***Late Project, PPT, reviews submission: Wednesday, April 29, 2026*** **PRESENTATION** ***Project presentations: Thursday, April 23, 2026 // 15:35 – 16:15*** ***Late project presentation: Wednesday, April 29, 2026 (time TBA)*** *Work submitted late and <u>within 6 calendar days</u> after the deadline will be penalized by 10% for each day of delay to a minimum of **40** points (for passing grades). Students will fail the assessment if work is submitted after the late submission deadline.*		

College regulations regarding academic integrity and offences stand, as they are described in the Undergraduate Catalog & Student Handbook, pp 52-56.

Generative AI tools (such as ChatGPT) may be used only as authorized by your instructor. Every other use will be treated as a case of academic misconduct.

Small-scale software design and development

Groups of 3 will be formed. In the case of an even number of students in the class there will be one group of 4 or two of 2. The expected work will be adjusted accordingly.
One submission is required per group, except for the part 'individual reflections'

Your work must address one of the following problems/concepts:

- Booking
- Ticketing
- Sales and stock management
- Crowdsourcing
- Game

Decide on the context and the tools (e.g programming language) and use the template available on Blackboard to prepare a proposal.

A. Work Progress & Supervision

Supervision of this work starts the 4th week of classes and continues until the end of the term. The process includes 4 progress deliverables. There will be one mandatory meeting with each team separately (COMMUNICATION phase).

PREPARATION: TEAM DETAILS (THROUGH BB)
Complete the questionnaire on BB, which includes the following questions:

1. Name of team.
2. Team members.
3. Topic area.
4. Topic context.

PREPARATION: TIMETABLE (progress deliverable 1)
Prepare a weekly timetable of the team's estimated progress. The timetable must:

- Plan both the overall teamwork and the individual members' work
- Include work merging milestones (if applicable).
- Make sure to include reference to the progress deliverables [2,3,4] (to be submitted as per the outline).
- Include one COMMUNICATION appointment with your instructor who will act as the stakeholder(s).
- Include the in-class progress meetings, with rather concrete aspects you plan to have completed (code and report respectively) and request formative feedback on.

PROGRESS DELIVERABLES 2, 3, 4
Progress deliverables contribute to the portfolio of engagement. Timely submission will ensure timely feedback. All feedback from the progress deliverables must be integrated to the final submission as appropriate.

PM deliverable #2: non-functional requirements
PM deliverable #3: code UML
PM deliverable #4: risk analysis

B. Submission and Marking

SUBMISSION

The marking process of the project requires **ALL** methods of submission indicated on the cover page of this document (Method of Submission). Failure to submit in all forms will result to FA.
Work submitted as per the instructions, and at the level of detail discussed and agreed for each project separately, will receive full points.

C. Project Specification

PART 1: Report

Every team should prepare and submit a report to present the analysis of the requirements, the model of your chosen software system, as well as implementation and deployment information, including technical and user documentation.

It is strongly recommended, although not mandatory, to use the project template available on Blackboard. In all cases, your paper must include the following:

a) Introduction
   - Abstract description
   - Keywords
b) Background research
   - Everything considered (articles, online sources, web sources, etc) relevant to the topic
   - Reasoning for checking the specific sources
   - Contribution of these sources to the work
c) Overall Description
   - Short general description, including tools/languages used and reasoning
   - Functional Requirements (as a high-level list of features)
   - User classes
d) System design – Conceptual UML
e) Non-Functional requirements & Quality considerations
f) Traceability, Testing strategy and proof
g) Documentation: user manual, technical manual (including class model or corresponding code model)
h) Risk Analysis
i) Cost Estimation
j) Conclusions: overall assessment of the software, essential comparison with similar application problems, possible enhancements.
k) Appendices:
   - Team Reflections: challenges you faced, deviations from the original proposal and reasoning, deviations from your suggested timetable and reasoning
   - Deployment instructions, including test user accounts and credentials (if applicable)
l) Citations

In your final submission, you must have integrated all feedback you have received in the context of the progress monitoring.

PART 2: Code

Develop and submit the software of your chosen topic. You must have integrated all feedback received for the increment(s). Make sure that your code:

a) is effective
   - compiles successfully
   - does not crash
   - produces correct results
   - is consistent with the design and the agreed requirements
b) is structured and modular
c) is efficient
d) is user friendly and promotes the user experience
e) includes adequate in-code documentation

PART 3: Project Presentation

The presentation must include a PowerPoint to be used as visual aid, and demonstration of the running software, as follows:

- An intro slide mentioning: the name of the team, the names of the members of the team, the class title and name, the semester.
- Short description of the project. Functionality.
- Topics of background research
- Programming language used, and other technologies if and so.

------- *demonstration of the running software* ----------

- Quality considerations. // Future enhancements.
- A closing slide (thanks and citations)

Each team will have approximately 15 minutes, including questions. It is recommended that you time yourselves, and make every effort to not exceed the 10 mins, as 5 mins will be used for questions and comments.

D. Peer-review / Self-review

Everyone must complete individually the peer and self-review on Blackboard.
